System Calls Programming

Aim: To experiment system calls using fork(), execlp() and pid() functions.

Algorithm:

1. **Start**
 - Include the required header files (stdio.h and stdlib.h).
2. **Variable Declaration**
 - Declare an integer variable pid to hold the process ID.
3. **Create a Process**
 - Call the fork() function to create a new process. Store the return value in the pid variable:
 - If fork() returns:
 - -1: Forking failed (child process not created).
 - 0: Process is the child process.
 - Positive integer: Process is the parent process.
4. **Print Statement Executed Twice**
 - Print the statement:

```
scss
Copy code
THIS LINE EXECUTED TWICE
```

(This line is executed by both parent and child processes after fork()).

5. **Check for Process Creation Failure**
 - If pid == -1:
 - Print:

Copy code
CHILD PROCESS NOT CREATED
 - Exit the program using exit(0).
6. **Child Process Execution**
 - If pid == 0 (child process):
 - Print:
 - Process ID of the child process using getpid().
 - Parent process ID of the child process using getppid().
7. **Parent Process Execution**
 - If pid > 0 (parent process):
 - Print:
 - Process ID of the parent process using getpid().
 - Parent's parent process ID using getppid().
8. **Final Print Statement**
 - Print the statement:

```
objectivec
```

Copy code
IT CAN BE EXECUTED TWICE

(This line is executed by both parent and child processes).

9. End

Program:

FOR SYSTEM CALL PROGRAM

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
int main()
```

```
{
```

```
    int pid;
```

```
    pid = fork();
```

```
    printf("\n THIS LINE EXECUTED TWICE");
```

```
    if (pid == -1) {
```

```
        printf("\n CHILD PROCESS NOT CREATED\n");
```

```
        exit(0);
```

```
    }
```

```
    if (pid == 0) {
```

```
        printf("\n I AM CHILD PROCESS AND MY ID IS %d\n", getpid());
```

```
        printf("\n THE CHILD PARENT PROCESS ID IS: %d\n", getpid());
```

```
    }
```

```
    else {
```

```
        printf("\n I AM PARENT PROCESS AND MY ID IS: %d\n", getpid());
```

```
        printf("\n THE PARENTS PARENT PROCESS ID IS: %d\n", getpid());
```

```

printf("in it can be executed twice") ;
printf("in");
}

```

Output:

```

THIS LINE EXECUTED TWICE
THIS LINE EXECUTED TWICE
I AM CHILD PROCESS AND MY ID IS: 12845
THE CHILD PROCESS ID IS: 12844

I AM PARENT PROCESS AND MY ID IS: 12844
THE PARENTS PARENT PROCESS ID IS: 12843

IT CAN BE EXECUTED TWICE
IT CAN BE EXECUTED TWICE

```

Result:

Thus the system calls program to experiment system calls using `fork()`, `execvp()`, and `pid()` functions has been executed successfully.
